How To Install A Small To Mid Size Solar & Wind Power Generation System

How to Install a
Small to Mid Size
Solar & Wind
Power Generation
System

BY T. M. LAMB

Synopsis

How to Install a Small to Mid size Solar Power and Wind Generation System Using/Installing Solar Panels plus info on Wind Generator Installation Most people think that solar power is only used to power huge inverters to attach to the power grid and feed extra power back into the grid. Well yes you can do this IF you have thousands and THOUSANDS of dollars to spend. Most people don't even think or realize how much you can do with 12 volt power. I have 98% of all the lights inside and outside my home are 12 volt LED's. Most of my LED lights use only 3 watts or 6 watts of power. I have a 12 volt Evaporative (swamp) Cooler to cool my home on hot summer days. I have a 12 volt coffee pot to make my coffee in the morning. I wake up with a 12 volt alarm clock. I have 12 volt electric blankets in my home I use on cold winter nights to keep me and my wife toasty warm. I have several 12 volt fans and 12 volt water pumps for my Aquaponics system. I have a 12 volt refrigerator you can buy at about any truck stop and it works great (no freezer though). I can even make FREE hot water with my 12 volt power system. With a small inverter I can charge my cordless power tools. I do use a 3000 watt inverter, that is dedicated to power my sump pump (if it's needed), that is the only thing I use that inverter for. Everything else is 12 volt. When we do lose power the ONLY way I can tell is the TV stops working. And you can buy a 12 volt TV and DVD player also. You too can live on 12 volt power just as I do. I live in an all electric home with 3 teenagers who all have their own big TV's, video games etc. I have electric hot water heater, a huge chest freezer, electric heat and air, electric cook stove and my smallest "grid" power bill was \$67.00 (my average power bill is (\$80 to \$90) at a time when my neighbors power bill is running \$250.00 to \$300.00

Customer Reviews

Oh, Yeah! Very informative and to the point. I know some things about batteries and voltage, and from what I know, he was dead on 100% accurate. He has given great ideas on what batteries will work best and how to connect everything and run the wires. He also mentions that one of the sources will help you set up a system. Well written, Flows Well even though it has a little "rustic" viewpoint. I easily give this 5 Stars as it is well worth the money. I have read some larger books and didn't get the advice he is giving here.

I like the no fluff approach and written entirely from the hard knocks of experience. Can't beat that. Well done and recommended.

Was expecting more of a breakdown on what a person can do to start up a solar project. I have yet to find the book that fills my needs and this is one was not even close.

I found this a superficial approach to the subject. Using DC has its limitations and a discussion of the pros & cons of AC V DC is critical to what one chooses to do. The book does provide some good ideas if one is OK with the limitations of DC.

Very little technical information included . The author just describes in words without diagrams what he did to set up his system. He includes a few pictures of his system but it looks like a train wreck.

I live in a place withy lots of sun and frequent good winds. So the idea of generating msome of my own power in interesting.

Couldn't download complete book

Good knowledge but could just be researched with online digging
