McGraw-Hill authors represent the leading experts in their fields and are dedicated to improving the lives, careers, and interests of readers worldwide

Having taught from this book, I think it's a great curriculum to use with students who aren't interested in theory, but would rather know "why are we doing this?" This book branches out into how geometry is found in culture, such as art, and applied in daily living. If you are more interested in answering students' questions about "when are we ever going to use this?" than you are about writing proofs all the time, this is a perfect book for you.

I love mathematics and read math book of all sorts, including textbooks. I teach music theory (which

is similar to math) at the college level, and have been doing so for the last 18 years. This is the worst math book I have ever seen. Where are the brilliant proofs of Euclid? This is a hodgepodge of history, so-called music, and diverse topics thrown into one book, that consists of nearly formulae and prove it yourself theorems. The Pythagorean formula is circular, if you can follow it back far enough. There are no concepts or brilliant ideas, only "you do it this way" as in the old calculus books. The authors are all school teachers, with one college teacher (wow). The school teachers have been complaining for years about how bad the "new math" was when the mathematicians wrote the texts; now it is their turn and they have turned my child off to math by their dull pedantic book. I think all schools should review this book before using it.
